

ultramodern.

amalgam for advanced practices.

Most practitioners still use amalgam, and for good reason. It's exceptionally strong. But some patients have concerns about mercury content. With Benco Dental non-Gamma II Amalgam, you can reassure them while enjoying exceptional handling characteristics and performance. That's because our formulation contains just the right amount of mercury necessary to ensure optimal, controlled expansion, plasticity and excellent marginal adaptation. Each formulation offers the early compressive strength you'd expect, plus smooth carving, high polishability and a generous working time. Benco Dental Amalgam is zinc-free, and works great with either low- or high-energy mixers. Benco Dental Amalgam exceeds all existing standards, so it will live up to yours.

SPHERICAL AMALGAM: Atomized spherical particle alloy, contains silver (55%), tin (28.8%) and copper (16.2%). Dimensional change upon hardening: <0.04%. Static creep: <0.1%.

ADMIX AMALGAM: Blend of spherical and irregular particles: silver (50.5%), tin (29.5%) and copper (20%). Dimensional change upon hardening: <0.05%. Static creep: <0.2%
